Pred. No. is the number of results predicted by chance to have a

score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

```
This nucleic acid comprises the hmw2 gene of non-typeable
Haemophlus influenzae strain 12 that encodes high molecular
Weight surface protein 18M2 (see AAW30294). A phage genomic
library of strain 12 was screened for clones expressing high
Strongly reactive clones were subcloned into T7 expression
Strongly reactive clones were subcloned into T7 expression
blasmid; all expressed either 120 kba HMW2 or 125 kba HMW1 (see
AAW30293). The expressed proteins are truncated, starting at
residue 442 of both full-length HMW1 and HMW2 gene products.
Correct processing requires the products of additional
correct processing requires and peptides can be used in
correct process or ne used as to prepare recombinant proteins and as
correct processing requires for prepare recombinant proteins and as

These epitopes can then be synthesised using standard techniques and incorporated into fully synthetic or recombinant vaccines.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 0; Gaps

```

The invention relates to the recombinant production of Haemophilus influenzae high molecular weight (HWW) proteins in Escherichia coli. The expression construct used to effect recombinant expression comprises a promoter functional in E. coli (e.g., the T7 promoter) operably linked in a modified humwaBC operon from a non-typeable (non-encapsulated) H. clusters termed humwlaBC and humwaABC. Each humwaBC operon comprises humw, mwB and humwC genes. The humw agnes encode the structural HWMA proteins responsible for post-translational processing and secretion of the HWWA proteins. The modified humwaBC operon used in the expression construct of the invention contains an A gene modified such that it encodes only the cand HWMA. The invention also discloses humw agenes (AAAS175-AS2198) strains Joyc, K1, K21, LCDC2, PWH1, 15 and 12. The nucleic acids and evectors are used for the production of recombinant H, influenzae HWWA critical munner response to provide protection against diseases in Example 16; Fig 29A-N; 307pp; English.

                                                                                                                                                                                                                                                                                                                     protect against disease caused by non-typeable Haemophilus which are not controlled by H. influenzae type b (Hib.) vaccines. The encoded protein can also be used as a carrier for protective Hib polysaccharide (in a conjugate vaccin against meningitis) or for other antigens, haptens, etc. This DNA sequence is part of a larger sequence encoding a gene cluster for the hmw2 gene (9323 bp).

```
This nucleic acid comprises a gene cluster for the hmw2 gene (see also AAT90995) that encodes high molecular weight surface protein HMM2 (see AAM30294) of non-typeable Haemophilus influenzae strain 12. In addition to the hmw2 gene there are 2 additional downstream open reading frames that are required for the correct processing and secretion of the hmw1 gene product. The ORF-b derived amino acid sequence demonstrates similarity with the derived amino acid sequences of 2 genes which encode proteins required for secretion and activation of haemolysins of P. mirabilis and S. marcescens. HWM proteins (see AAW30291-94) can be used in vaccines, as Immunogens for preparation of antibodies and as antigens for detection of
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      61 CACCTTTTTGCAGTCTATATGCAAATATTTTAAAAAATAGTATAAATCCGCCATATAA 120
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 121 AATGGTATAATCTTTCATCTTTCATCTTTCATCTTTCATCTTTCATCTTTCAT 180

Loosmore SM, Yang Y, Klein MH;

WPI; 2000-303789/26. P-PSDB; AAB01849 Nucleic acid molecule for producing recombinant high molecular weight proteins of Haemophilus which are used as a vaccine to provide protection against Haemophilus induced diseases in humans

Claim 7; Fig 29E-N; 307pp; English.

The invention relates to the recombinant production of Haemophilus

Influenzae high molecular weight (HMW) proteins in Escherichia coll. The
expression construct used to effect recombinant expression comprises a
promoter functional in E. coli (e.g., the T7 promoter) operably linked

to a modified hwwABC operon from a non-typeable (non-encapsulated) H.

Influenzae (NTHI). Most HMW-expressing NTHI strains contain two hmw gene
clusters termed hmwABC. Each hmwABC operon comprises hmwA,
clusters termed hmwABC. Each hmwABC operon comprises hmwA,
clusters termed hmwABC and hmwABC. Each hmwABC operon comprises hmwA,
and the hmwB and hmwC genes encode accessory proteins which are
responsible for post-translational processing and secretion of the HMWA
contains and sand a gene modified such that it encodes only the
mature HMWA. The invention also discloses hmwA genes (AAASI199)
mature HMWA proteins (AAB01824-801849) from the non-typeable H. Influenzae
and HMWA proteins (AAB01824-801849) from the non-typeable H. Influenzae
strains Joyc, KI, K21, LCDC2, PMHI, 15 and 12. The nucleic acids and
proteins which can be used as vaccines to mediate a humoral or
cell-mediated immune response to provide protection against diseases in
humans caused by H. Influenzae (e.g., otitis media, epiglottitis,
humans caused by H. Influenzae (e.g., otitis media, epiglottitis,
endiates and cracheobronchitis). The HMW proteins are also useful as
antiquens in immunoassays for detecting antibodies against Hemophilus,
HWW proteins and/or HWW peptides. The nucleotide sequences encoding a mature
converged to the protein and classified of the modified NTHI hmwA gene encoding a mature
converged to the proteins and of the modified NTHI hmwA gene encoding a mature
converged to the proteins and modified of HWA proteins.

These epitopes can then be synthesised using standard techniques and incorporated into fully

The HMW1 protein encoded by this sequence is useful in a vaccine to protect against disease caused by non-typeable Haemophilus which are not controlled by H. influenzae type b (Hib) vaccines. The encoded protein can also be used as a carrier for protective Hib polysaccharide (in a conjugate vaccin against meningitis) or for other antigens, haptens, etc. This DNA sequence is part of a larger sequence encoding a gene cluster for the hmw1 gene (9011 bp).
                                                                                                                                                                                                                                                                                                                             Ouery Match

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Haemophilus influenzae strain 12 that encodes high molecular weight surface protein HWMI (see AAW30291). A phage genomic library of strain 12 was screened for clones expressing high molecular strongly reactive choices were subcloned into 77 expression plasmid; all expressed either 125 kDa HWM1 or 120 kDa HWW2 (see Pannid; all expressed either 125 kDa HWM1 or 120 kDa HWW2 (see AAW30294). The expressed proteins are truncated, starting at cresidue 442 of both full-length HWM1 and HWW2 gene products.

Correct processing requires the products of additional downstream genes (see AAY30995 and AAY30995). Nucleotide sequences constructions of see AAY30995 and AAY30995 and AAY30995 and AAY30995 and AAY30997. On the Control of the HWM proteins of non-typeable H.

Influenzae strain 5 (see AAW30291-92) have also been identified.

The HWW proteins, conjugates and peptides can be used as a munogens for preparation of antibodies and as antibodies and as antibodies and be used as to prepare recombinant proteins and as probes for detection of related genes.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Nucleotide sequences
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      54.3%; Score 2680.2; DB 18; Length 5116; nilarity 73.5%; Pred. influenzae high molecular weight (HWW) proteins in Escherichia coli. The INTELLINI Intelacts to use tecombinant expression congrises a promoter functional in E. coli (e.g., the T7 promoter) operably linked to a modified humwabc operon from a non-typeable (non-encapsulated) H. clusters termed humwabc operon from a non-typeable (non-encapsulated) H. clusters termed humwabc and humwabc coperon comprises humwabc clusters termed humwabc and humwabc coperon comprises humwabc characters termed humwabc and humwabc coperon comprises humwabc characters termed humwabc accede the structural HWMA proteins cresponsible for post-translational processing and secretion of the HWMA proteins and a gene modified such that it encodes only the proteins. The modified humwabc operon used in the expression construct of mature HWMA proteins (ARB01834-901849) from the non-typeable H. influenzae contrains and secretion of recombinant H. influenzae HWM proteins (ArB01849) from the non-typeable H. influenzae coll-mediated immune response to provide protection against diseases in predensing and tracheobronchitis). The HWM proteins are used for the production of recombinant H. influenzae (coll-mediated immune response to provide protection against diseases in premonia and tracheobronchitis). The HWM proteins are also useful as antigens in immunoassays for detecting antibodies against Haemophilus, HWM proteins and house and the incolates and clone hum and the incolates and clone hum and the model and the incolates and clone hum and the humbanch and the incolates and clone humbanch and the production against Haemophilus, the HWM proteins and coloring the form the model and the production and proved and humbanch and the production against Haemophilus, the HWM proteins and coloring the form the model and the production and proved and proved the model and the production and proved and proved the model and the production and proved the production HMW proteins can be used to isolate and clone hmw genes from other non-typeable strains of Haemophilus via hybridisation reactions. The present sequence represents an hmwA gene from a non-typeable strain of H. invention relates to the recombinant production of Haemophilus

These epitopes can then be synthesised using standard techniques and incorporated into fully synthetic or recombinant vaccines.
                                                                                                                                                                                                                                                                                                                                                                                                                                  /note= "One of a gene cluster for high molecular

This nucleic acid comprises a gene cluster for the hmw1 gene (see also ART90994) that encodes high molecular weight surface protein IMM1 (see AAW30293) of non-typeable Haemophilus influenzes strain 12. In addition to the hmw1 gene there are 2 additional downstream open reading frames that are required for the correct processing and secretion of the hmw1 gene product. The ORF-b derived amino acid sequence demonstrates similarity with the derived amino acid sequences of 2 genes which encode proteins required for secretion and activation of haemolysins of P. mirabilis and S. marcescens. HWM proteins (see AAW30291-44) can be used in vaccines, as immunogens for preparation of antibodies and as antigens for detection of
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          41 ATGACAAACAACAATTACAACACCTTTTTTGCAGTCTATATGCAAATATTTTAAAAAAT 100

2 Novel nucleic acids (AAT90992 and AAT90993) respectively comprise the coding sequences of high molecular weight surface proteins HWW3 (see AAW30291) and HWW4 (see AAW30292) of Haemophilus influenzae strain 5. HWW3 has a mol.wt. of 125 KDa and HWW4 has a mol.wt. of 123 KDa. Both are antiquically related to HWM1 (see AAW30293) and HWW2 (see AAW30294) obtained from non-typeable H. influenzae strain 12 Vectors containing HWW nucleic acids for transformation of a host detection of related genes. HWW proteins, conjugates and peptides can be used in vaccines, as immunogens for preparation of

```

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

Patent No. 5928651
GENERAL INFORMATION:
APPLICANT: Barenkamp, Stephen J
TITLE OF INVENTION: High Molecular Weight Surface Proteins
TITLE OF INVENTION: of No. 5928651-Typeable Haemophilus
NUMBER OF SEQUENCES:
CORRESPONDENCE ADDRESS:
ADDRESSEE: Shoemaker and Mattare, Ltd.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     ADDRESSEE: Shoemaker and Mattare, Ltd.
STREET: 2001 Jefferson Davis Hwy., 1203 Crystal Plaza
STREET: Bldg. 1
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       MEDIUM TYPE: Floppy disk
COMPUTER: IBM PC COMPAILIBLE
OPERATING SYSTEM: PC-DOS/MS-DOS
SOFTWARE: Patentin Release #1.0, Version #1.30
CURRENT APPLICATION NATA:
SPLICATION VUMBER: US/08/728,470
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        CLASSIFICATION: 424
